USSR/Chemistry - Tungsten, Thoriated Apr 1948
Chemistry - Dissociation of Hydrogen

same Dissociation of Hydrogen on Pure and Thoriated
Tungsten, T. Ivanovskaya, I. Mochan, Physikochem
Inst, Acad Sci USSR, Leningrad, 5 pp

"Zhur. fiz. Khim" Vol XXII, No 4

Observe dissociation of molecular hydrogen on an
incandescent surface of pure and thoriated tungsten
at various temperatures and with various coatings
of thorium. Draw conclusion that greater energy
over thoriated tungsten occurs with greater energy
of activation. Show that the speed of dissociation
of activation. 67712

Effect of 2,4-D on tomatoes. T. L. Ivanovskaya.
Agrobiologiya 1949, No. 5, 113-26. Tomato plants in
pots sprayed with 2,4-D (10 mg. per l.) showed deforma-
tion of foliage after 28 days, whereas after 48 days there was
no deformation even with a concn. of 100 mg. per l. In
general, up to blooming the plants recover much better
from effects of 2,4-D, if placed in a favorable environment.
After blooming and fruit setting the plants do not respond
so well to improved environmental conditions. Changes
produced in tomato plants by 2,4-D treatment can be in-
duced by inoculating healthy plants with the juices of
plants treated with 2,4-D. J. S. Joffe

Title : Formation of Tubercles on the Roots of Soy in a Vegetation Experiment.

Orig Pub: Agrobiologiya, 1956, No 6, 29-34.

Abstract: In experiments of the Institute of Genetics AS USSR with soy and lupine, the possibility was studied of formation of tubercles on the roots of these plants in soils on which neither had ever been cultivated. Before sowing, the seeds were sterilized with sulfuric acid (1.5 minutes in acid of specific weight 1.84). In the course of the vegetative period each crop was cultivated

twice, so that for two years the experiments were variants with sowing four times in the same containers. Both in the first and second year of the experiment, tubercles were not formed on the roots of the soy and lupine. They did not appear with sowing with non-sterile seeds. Tubercles are normally formed in the first year on these soils in peas and beans. For the creation of a poorer base, in the second year half the soil was mixed with river sand in 50% of the vessels before sowing. In addition, an additional experiment was established with cultivation of plants on pure sand. In these variants, the tubercles were formed on the roots of the lupine and soy; in the soy, they were a non-typical form for this plant. With repeated cultiva-

Title : On the Problem of Intravariety Relations in Plants.

Orig Pub : Tr. In-ta genet. AN SSSR, 1956, No 23, 100-136

Abstract : The results of many experiments with monovaried and mixed, spaced and crowded plantings of various plants are cited. Underdevelopment and perishing of many individual plants in the conditions of crowding are explained by natural change, biologically useful self-specing, and action of external conditions. Due to the perishing of unnecessary individual plants the author was not able to artificially create overcrowding and on this basis, the conclusion is reached that there is no overcrowding nor intervariety struggle. -- G.N. Miroshnichenko

*Influence of ascorbic acid and of vitamin 'B' complex
upon the course of ether anaesthesia (Russian text)
EKSPER. KHIR. 1956, 1956, 2 (50-57)

Experiments on rabbits showed that vitamin complex (C in doses of 40 mg./kg., PP in doses of 5 mg./kg. and B₂ in doses of 0.4 mg./kg.) administered about one hour before ether anaesthesia, interfered with the course of anaesthesia by producing an 'awakening' action. During the ether anaesthesia the animals showed a less pronounced slowing down of the respiration and pulse rate, a fall of the temperature, hyperglycaemia and acidosis. When vit. C is excluded from the vitamin complex the 'awakening' action disappears without any influence upon the other factors mentioned. After the stage of excitation, no influence is exerted upon the course of ether anaesthesia by vit. C, PP and B₂. References 18.

Title : Features of electrolytic separation of metals of the iron group

Periodical : Zhur. Fiz. Khim, 28, Ed. 3, 567, March 1954

Abstract : According to modern ideas both atoms and ions of metals belonging to the iron group have a resultant spin moment which is different from zero. The presence of such moment in the atoms and ions of these metals is explained by their electrochemical behavior. The electro-chemical behavior of metals of the iron group is based on the structure of the atoms of these metals. The organization of the nucleus of the new phase (elementary nucleus) from particles having a resultant moment, different from zero, should be a much complicated process as compared with such process as compared with such process for particles not having the moment.

For an 11-year period (1943-1953) the count of cases of systemic blood diseases and of closely related diseases of the manifestly newgrowth order shows that the number of those who died from these diseases was 1.2% of the total number of deaths in this hospital. The most frequently encountered diseases of these groups in children were the acute myeloleucoses. The lympholeucoses, neither acute nor chronic, were not met with at all. The lymphosarcomatosis was comparatively frequently observed. The diseases of the haemopoietic organs were mainly observ-

CONT.

ed in the age group 5-10 yr. The acute myeloleucosis and lymphosarcomatosis predominated in male children. The aplastic diseases of the blood-forming organs in children took, as a rule, an acute course; they were accompanied by a marked haemorrhagic syndrome and the appearance in some cases of non-mature myeloid forms and even reticulated forms in the peripheral blood. In the majority of the cases the bone-marrow showed the appearances of proliferation of the reticular cells, which testifies to the paralysis of the maturation function of the cells of the bone-marrow, while the function of proliferation is preserved for some time and the draining function is lowered.

2732. IVANOVSKAYA T. E. and SEMIONOVA K. L. Moscow. *Pathological anatomy of congenital toxoplasmosis (Russian text) ARKH. PATOL. 1956, 18/7 (92-100) Illus. 11

After a historical survey of toxoplasmosis research (mainly foreign investigators; of the Soviet Union Zasuchin and Vasina are mentioned) 6 personal cases of congenital toxoplasmosis are reported. No data are given on any diseases during pregnancy. In all the autopsied cases, spherical calcified bodies and pseudocysts

2732

were found, with necrotic areas and inflammatory phenomena in the brain. Some of the cases took an acute course, others became more chronic. The clinical and morbid-anatomical pictures corresponded to meningo-encephalitis as known from the literature. In one case there was also a secondary infection. The nature of the cerebral damage in toxoplasmosis depends on the time of intra-uterine infection. Cases of toxoplasmosis are presumed to be often overlooked, and greater care in the examination of cases with congenital cerebral affections is therefore recommended.

PANCHEAS (Russian text) - Ivanovskaya T. E. and Zhukova E. K. -
ARKH. PATOL. 1958, 20/8 (55-64) litus. 9
Three autopsied cases of congenital pancreatic disease are reported. Congenital
hypoplasia was observed in 2 girls who died at the age of 26 and 16 months,
respectively, and fibrocystic disease in a girl who died at the age of 22 months.
In all 3 cases the clinical and pathological picture was similar; the former was
characterized by steatorrhea, hepatomegaly, malnutrition and infection, the
latter by fatty infiltration of the liver and by inflammatory and necrotizing lesions
in the lungs and in the intestinal tract. In all cases the insular apparatus was un-
changed. Very similar metabolic and pathological changes are obtained experi-
mentally when animals are kept alive with insulin after total pancreatectomy.

In connection with the decision of the December plenary session of the central committee of the CPSU on the increased role of the Trade-Unions in the struggle for the building of the communist state, the rights of trade-unions in industrial organizations and institutions were considerably widened. The trade-union of Geological workers of Eastern Siberia increased its activity. On the initiative of the working team of the Lugovskaya Geological Prospecting Team of the Mama-Chuyskoy ekspeditsii (Lugovskaya Geological Prospecting Team of the Mama-Chuya Expedition) (Head of the Team - A.V. Smirnov) the Irkutskoye geologicheskoye upravleniye (the Irkutsk Geological Directorate) opened a socialist competition for the creation of a "Fond mineral'nogo syr'ya i ment

semlitnogo plana" ("Fund of Mineral Raw Material
 ment Seven Year Plan"). Geologists of the Irkutskaya
 Team promised to increase the reserves of mineral raw
 materials 40 to 45% more than foreseen for the first
 year of the Seven Year Plan. This initiative was ap-
 proved by the board of the East-Siberian Territorial
 Committee of the Trade-Union, and by the Board of the
 Irkutsk Geological Directorate. Thirty-two brigades
 are taking part in this competition. Mining brigades
 of the Slyudyanskaya ekspedititsiya (Slyudyanka Expedi-
 tion) led by L.S. Vikhlyayev and T.F. Kravchenko,
 drilling brigades of the Irkutsk Vostsibneftegeologiya
 (the Vostsibneftegeologiya Trust) led by drilling
 masters V.M. Danashin and P.M. Korshunov, and the drill-
 ing detachment of the Sogdiondonskaya Team led by
 V.L. Novopavshin, and many others took a pledge to
 work, study and live according to communist ideals.
 On the initiative of the Irkutsk Geological Directorate
 and the Irkutskaya Oblast' Committee of the VIKSM a
 komсомол-youth drive for mineral deposits was organized

In 1958. More than 20,000 men took part in this drive, and the Irkutsk Geological Directorate is checking about 200 claims of discovery of mineral deposits. This initiative was approved by the Ministerstvo Geologii i Otkrytiy Nedr SSSR (Ministry of Geology and Conservation of Mineral Resources of the USSR), by the Central Committee of the Trade-Union of Geological and Prospecting Workers and by the Central Committee of VIKSM. This drive will again be repeated in 1959. For the organization of the drive, 27 persons received honorary diplomas, among them the teacher of the Shalekhovo secondary school S.F. Sitnikov, the secretary of the Irkutskaya Oblast' Committee of VIKSM, A.I. Golovnykh, and the head of the Lugovskoye Team of the Mama-Chuya Expedition, V.T. Kileso. Twenty-four participants received the badge of "Excellent Worker of the Socialist Competition of the Ministry of Geology and Conservation of Mineral Resources of the USSR." Special permanent production conferences have been organized throughout Eastern Siberia, at which plans for a better organization

Ivanovskiy, A. B.

SOV/20-125-3-42/63

On the question of Stratigraphic Position of the
Nizhneludlovskiy (Lower Ludlovian) Substage Within the Western
Part of the Siberian Platform (K voprosu o stratigraficheskom
polozhenii nizhneludlovskogo pod'yarusa v predelakh zapadnoy
chasti Sibirskoy platformy)

Doklady Akademii nauk SSSR, 1959, Vol 125, Nr 3, pp 614-615
(USSR)

The upper part of the Silurian limestone section is assigned
to the mentioned substage in the region named in the title
according to the scheme existing at present (Refs 1,2). Topical
geological investigations have been carried out here since 1955
by the Yenisseyekspeitsiya (Yenissey Expedition, directed
by S. P. Mikutskiy). The author identified the Silurian Rugosa,
which were collected by himself and members of the expedition.
On the basis of the identifications he arrived at the conclusion
that the masses mentioned in the title would be better and more
precisely assigned to the upper part of the Wenlockian Stage of
the Lower Silurian rather than to the Ludlovian Stage of the

Nizhneludlovskiy (Lower Ludlovian) Substage Within the Western Part of the
Siberian Platform

Upper Silurian. He criticizes the use of the ostracoda found there (Ref. 1) for stratigraphic conclusions and for the correlation of sections. There is of course a countless number of new forms, however, the older are lacking. The coelenterate fauna has an early Silurian character. This would be, in the author's opinion, further proof that this mass should be placed in the Upper Wenlockian. There are 2 Soviet references.

TITLE:

On the Taxonomic Position of Ordovician and Silurian Zaphrentis Corals (K voprosu o sistematicheskoy polozenii ordovikskikh i siluriyskikh zafrentoidnykh korallov)

PERIODICAL:

Doklady Akademii nauk SSSR, 1959, Vol 125, Nr 4, pp 895 - 897 (USSR)

ABSTRACT:

In spite of a vast distribution the taxonomy and phylogeny of the Silurian Rugosa corals are still to an only very small extent investigated. The solution of the problems of taxonomy would, however, clarify the biostratigraphic importance of the Rugosa. On the strength of his own investigations of the Siberian Rugosa and on the strength of other publications the author revised partly the taxonomy of the tetrastrate corals mentioned in the title. He succeeded in indicating a certain phylogenetic series among the latter. The author refers to it as a family - Protozaphrentidae fam. n., describes and illustrates it. (Figs 1,2). The following genera belong to this family: Protozaphrentis Yü, Archaeozaphrentis Ivan. (in litt.), as well as Tungusozaphrentis gen. n. (Fig 1). The evolution of the aforesaid phylogenetic branch can be fol-

Card 1/2

On the Taxonomic Position of Ordovician and Silurian Zaphrentis Corals SOV/20-125-4-58/74

lowed from the Middle Ordovician up to the late Silurian. Tungussophyllum gen. n. was created for the genera Zaphrentis conulus, obesa, vortex, and stockesi. The position of Z. conulus to Rhexmaphyllum (Ref 3) is scarcely confirmed. The classification (I - V, Refs 2,3) and the evolution direction of the corals in question are given. There are 2 figures and 5 references, 1 of which is Soviet.
